

Start-up Ask Attis B.V. (Antwerp) has built a technology to detect disease and vermin on food crops. It launched the first solution in the form of a mobile application, namely PLANTICUS. [www.planticus.com](http://www.planticus.com)

Since the launch of Ask Attis, the app PLANTICUS has been downloaded in more than 66 countries, including Belgium, the Netherlands, the United Kingdom, the United States, Zambia, Zimbabwe, South Africa, Australia, Tanzania, India, Vietnam, Malawi, and others.

To date, there are more than 1330 active users.

In the meantime, Ask Attis is working on the realization of its sustainable projects. Together with an NGO in Taiwan, the start-up is currently preparing a sustainable project in Cambodia and Laos. This project aims to allow around 1,000 local farmers to use Ask Attis' technology free of charge to protect their food crops so that they can guarantee food.

Ask Attis is also informing us that a new product called, care4crops will be launched in Q3 2021. Specially designed for the tomato industry. More details can already be found on the website: [www.care4crops.com](http://www.care4crops.com)
